

## NetTools WEB Network Performance Management

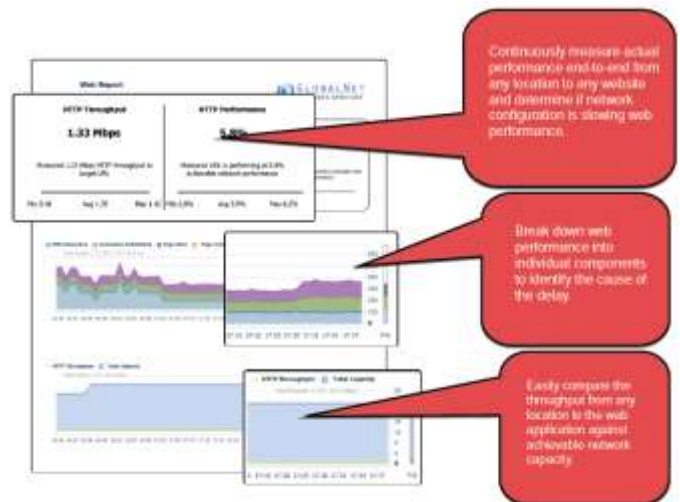

### Are you blaming bandwidth for every application performance issue?

*Monitor and troubleshoot real-time performance for any internal or external web application from any remote location*

NetTools Web is an add-on module to the Network Performance Management service which provides unique visibility out to the critical websites and web applications that your organization depends on. From CRM services, to backup, to custom web applications you need to understand the performance from your end users to these web servers, and prepare accordingly to ensure top networked application performance.

NetTools Web is a necessary service for any organization that relies on web-based applications, or for whom website connectivity is crucial to business operations.

- Active application performance monitoring
- Continuously monitor the performance and uptime of any web site from the perspective that matters most, your offices and customers
- Analyze HTTP/S and DNS to determine the cause of poor performance, identifying exactly how fast a network can deliver web traffic and compare against live web traffic
- Works against internal and external web servers, including third party web sites with no modification

### With Tier3's NetTools WEB – you can easily and quickly answer these questions:

How fast can this network deliver web applications?

How fast is my web application to my user base?

Why are my web applications performing slowly?

Why is my website connection so slow?

Talk to Tier3 Technologies today to find out how you can quickly and easily deploy this low cost solution.

At Tier3 Technologies we save companies money on IT – period.
